Testing Procedure

We need feedback since this procedure will be applied remotely from later on.

My Feedback

- The testing tools are automatized but are not in the loop of everyone's development cycle.
- No one provided the manual assertions, so 20+ assertions are not even „not implemented“

My Feedback

- Github is not well suited for this fast paced changes when submitting TDs, results and report during the testfest:
 - Someone needs to merge, pull the changes etc.

Solution

FTP or Dropbox-like folder sharing infrastructure until the results are fixed for a final version which are then pushed to Github

Suggestions?
